

Steps in K-Means Clustering

1. Define the value of **K** (number of clusters)
2. **Initialize** K **centroids** randomly
3. Compute the distance of each data point to all centroids
4. Assign each data point to the nearest centroid
5. Recompute the centroid by taking the mean of all points in that cluster
6. Repeat steps 3 to 5 until cluster assignments no longer change or **centroids stabilize**
